### **Candidate Answer Evaluation**

#### Conclusion

- This work achieved 95.4% accuracy (macro- $F_1 \approx 0.96$ ) across four English emotion datasets, with calm recall reaching 98% using light augmentation and progressive dropout. It outperforms prior studies—Liu et al. (77–86%), Wani et al. (~80%), and Issa et al. (71.6–95.7% on German EMO-DR)
- The candidate answer evaluation pipeline dynamically scores HR and Technical responses using GPT-4o-based rubrics, RAG-enhanced historical retrieval, and a blended scoring strategy that ensures contextual relevance and fairness.
